

KHAR NAN THIT

TCD, Water Committee

PRE-CONDITION

The community has a protected water source where the entire community can access within 5 minutes. It is underground drilled water (around 100 feet). The water is clean, no bad smell, no color, and it produces enough water for every household. The water has never been tested. Instead, government health worker provided tablets to clean the water and put chlorine once.

HEALTH PROBLEMS

The villagers suffer stomachache, diarrhea, headache and kidney problems. Within four years of settlement in this location, 2 kids under 5 years died. They think the causes are not having safe water, lack of health education, no proper latrines etc. More over,they don't have enough water for household use when there is no electricity.

CAUSES

The community thinks that the root causes of their sickness related to their water source. But they really don't know whether the water is clean or contaminated because they have never tested the water.
